Acknowledgments

Funding for this project was provided through the New Jersey Department of Health, Division of Family Health Services. We are grateful for the support provided by the members of the evaluation planning team: Uta Steinhauser, Melissa Santorelli, and Nashon Hornsby. A special thanks to the Camden Coalition of Healthcare Providers, Greater Newark Healthcare Coalition, and Trenton Health Team for providing the data. Finally, we thank CSHP colleagues Jennifer Farnham, M.S., for her editorial comments and Bram Poquette, M.L.I.S., for his contributions in formatting this report.
Executive Summary

Faithful Families Eating Smart and Moving More (FFESMM) uses a multi-level model that focuses on both individual behavior change and policy and environmental change within the faith community. As part of the Centers for Disease Control and Prevention’s Preventive Health and Health Services Block Grant (PHHSBG) funding, the New Jersey Department of Health (NJDOH) piloted the Faith in Prevention Initiative in three cities: Camden, Newark, and Trenton. The NJDOH provided grants to the Camden Coalition of Healthcare Providers (CCHP), Greater Newark Healthcare Coalition (GNHC), and Trenton Health Team (THT) to expand the role of Faith-Based Organizations (FBOs) in the delivery of preventive health services in these communities. The goal of this initiative was to: 1) encourage the faith community to adopt policy and environmental changes that promote better health; 2) educate the faith community members about health-improving life changes for better health; and 3) build partnerships between health care systems and faith-based organizations to improve health outcomes among congregants. For Year 1, each grantee received an award of $300,000 for hiring dedicated program staff, and buying program materials, conducting trainings of lay leaders, and funding mini-grants to implement evidence-based strategies to effect policy, environmental, and behavioral change within the FBO. The connection between faith and physical health is an important aspect of FFESMM and was part of the key teachings of the participating FBOs. The curriculum is co-taught by health educators and trained lay leaders.

The NJDOH contracted with Rutgers Center for State Health Policy (CSHP) to assess the effectiveness of the program in changing individual behavior as well as practices and environments of faith communities. Two survey instruments were used to assess the implementation of the Faith in Prevention Initiative which utilize Faithful Families Eating Smart and Moving More (FFESMM) program: 1) pre/post Faith Community Assessment; and 2) pre/post Faithful Families Member Health and Interest Survey.
Overall, 26 FBOs in the three cities participated in the program. Among those who participated, 350 participants completed the pre-test, 290 completed the post-test, and 25 participants completed the three month post-test.

**Impact on FBOs:** All faith-based organizations had at least some health and wellness infrastructure in place and many reported developing new partnerships and programs and implementing changes to their nutrition and physical activity environment and policies for better health of their congregants. Participants shared interest in seeing their faith communities serving healthy meals and snacks and providing space as well as opportunities for members to be more physically active.

**Impact on Participants:** This focus on prevention and wellness had a positive impact on the participants. The data indicated better outcomes for most measures (increased knowledge and understanding, change in behavior for healthier eating and physical activity, and an improvement in faith community environment to support healthier lifestyle) in the post-test. Participation in the Faith in Prevention Initiative led to reported improvement in eating smaller portions, increasing consumption of fruits and vegetables, decreasing consumption of sugar sweetened beverages, planning weekly menus, preparing more meals at home, and spending more time doing physical activity. The pre/post differences were statistically significant ($p < .05$) for seven items in Camden (consumption of sugar-sweetened beverages, choosing healthier options and controlling portions to manage weight, trying to be more physically active, trying additional ways to be physically active such as using stairs or walk or bike to places, and changes in the faith community environment) and three items in Newark (consumption of fruits, planning weekly meals, and choosing healthier options and controlling portions to manage weight) indicating that the program did help participants change their eating and physical activity behavior. However, a pre/post comparison of participant data is not reported for Trenton because the questionnaires used for pre- and post-test were different from each other. The three month post data for Trenton affirm that participants maintained changes in healthy eating and physical activity behavior after three months following program completion.

Overall, the surveys show that the Faith in Prevention Initiative had a positive effect on both FBOs and members. The results are pivotal to participating FBOs and participants in Year 2 as it demonstrates that the intervention did help in building a culture of prevention and wellness for both the FBOs and the faith community members.
Evaluation of the Faith in Prevention Initiative: Year 1 Report

Manisha Agrawal, M.P.H. and Margaret Koller, M.S.

Introduction

Faithful Families Eating Smart and Moving More (FFESMM) is a “practice-tested intervention” that focuses on both individual behavior change and policy and environmental changes within the faith community. The FFESMM program, originally developed in North Carolina (http://www.faithfulfamiliesesmm.org/), is a multi-level programmatic intervention that involves the community in program design and provides opportunities to influence health behaviors at the individual, interpersonal, organizational, and community level. The FFESMM framework serves as a link between the faith community and local resources. It promotes healthy eating habits and increases physical activity through a series of group nutrition and physical activity education sessions. These sessions are designed to encourage the faith community to identify its needs (for supporting health and wellness of members) and adopt policy and environmental changes to meet those needs, and empowers the faith community members to make health-improving choices. These efforts address key factors such as physical inactivity and unhealthy eating that raise the risk of diseases. The lessons are co-taught by nutrition and physical activity educators and trained lay leaders from faith communities in small group sessions.

FFESMM can be adapted to any faith tradition. Promoting the connection between faith and health is important to the success of Faithful Families. Health messages from the faith community may have a greater impact on individuals as members may be more open to health messages received from faith community leaders. Families begin to consider how their physical health is connected to the faith they live out daily and help them in becoming advocates for policy and environmental changes that promote healthy eating and physical activity in their organization and in the community at large.

In 2014, the New Jersey Department of Health (NJDOH) received Prevention and Public Health Funds under the Preventive Health and Health Services Block Grant (PHHSBG) from the Centers for Disease Control and Prevention (CDC) for implementing community based primary prevention services. The Faith in Prevention Initiative, a pilot project under this grant, focused on: 1) recruiting faith-based organizations to participate in the pilot to implement changes in
environments and practices to support healthy eating and physical activity; and 2) changing individual behavior by giving them the information they need to Eat Smart and Move More. This is in line with the U.S. Department of Health and Human Services Healthy People 2020 objectives, specifically Educational and Community-Based Programs (ECBP) 10.7, 10.8, and 10.9, which call for an increase in the number of community-based organizations (including local health departments, Tribal health services, nongovernmental organizations, and State agencies) providing population-based primary prevention services in the areas of chronic disease, nutrition, and physical activity. The NJDOH contracted with Rutgers Center for State Health Policy (CSHP) to assess the effectiveness of the program in changing individual behavior as well as practices and environments of faith communities.

Methods

The NJDOH provided grants to Camden Coalition of Healthcare Providers (CCHP), Greater Newark Healthcare Coalition (GNHC), and Trenton Health Team (THT) to implement the Faith in Prevention Initiative utilizing the FFESMM curriculum within congregations in Camden, Newark, and Trenton respectively. Year 1 of the program was October 1, 2014–September 30, 2015. The evaluation design is a pre/post design with no comparison group. The existing FFESMM tools (as developed by the North Carolina Department of Health) were modified for the target population by CSHP with input from NJDOH. Two different types of data collection tools were used:

- Pre/post Faith Community Assessment Survey: provides information about the environment, policies, and practices in place to support healthy eating and physical activity in the participating faith community.
- Pre/post Faith in Prevention Member Health and Interest Survey (MHIS): helps determine the impact of the program on participants in making healthy food choices, planning meals, health beliefs, food safety and physical activity. (Note: Trenton Health Team used a different version of MHIS for pre-test and “Participant Survey” from the FFESMM curriculum for post-test. This prevented across-the-board analysis later in the report).

The grantees mailed/emailed the survey data to CSHP for data entry and analysis. All participant data were de-identified, and were analyzed using SPSS. This report includes comparison of frequencies of all survey items for participants completing pre-test (Camden = 131; Newark = 56) and post-test (Camden = 132; Newark = 36). It also includes comparison of frequencies of all survey items for participants completing both pre- and post-test (Camden = 71; Newark = 25). For Trenton (pre-test = 163; post-test = 122), a pre-post comparison of frequencies are not reported due to different versions of the form. A paired t-test of the matched sample was used to determine whether mean differences of all survey items before and after attending the sessions were statistically significant. In addition, two faith-based organizations (FBOs) in Trenton
collected three month post-test data. This report also includes pre- (N=22) and three month post-test (N=25) comparison of frequencies of all survey items from the two FBOs.

A human subjects protocol for the study was reviewed and approved by Rutgers University’s Institutional Review Board (IRB).

**Results**

Overall, 26 FBOs in the three cities participated in the program. Among those who participated, 350 participants completed the pre-test, 290 completed the post-test, and 25 participants completed the three month post-test. Sections I to III contain detailed findings for each grantee:

- Section I: Camden Coalition of Healthcare Providers
- Section II: Greater Newark Healthcare Coalition
- Section III: Trenton Health Team
Section 1: Camden Coalition of Healthcare Providers (CCHP)

Data Collection

CCHP submitted the following completed forms to CSHP for analysis. All participant data were de-identified and analyzed using SPSS.

Data Sources

- Faith Community Assessment: 9 FBOs completed both pre- and post-test.
- Member Health and Interest Survey: 131 participants completed the pre-test and 132 completed the post-test.

Summary Findings

- **Impact on FBOs**: As a result of participation in this initiative, all FBOs made many changes to their health and wellness infrastructure, partnerships and programs, and physical activity and nutrition environment and policies. Overall, three FBOs implemented physical activity policies and five FBOs implemented policies for serving healthy meals. They may consider annually assessing their needs and priorities for improving their infrastructure, identifying additional partnerships, increasing opportunities for physical activity, and developing new nutrition policies and practices.

- **Impact on Participants**: Overall, the results indicate that participation in FFESMM sessions was associated with better outcomes for most measures (increase in knowledge and understanding of a healthier lifestyle, change in behavior for healthier eating and physical activity, increased skills to plan and eat more meals at home, and an improvement in faith community environment to support prevention and wellness).
  - Among matched participants, the pre/post differences were statistically significant for seven survey items: 1) consumption of sugar-sweetened beverages; 2) choosing healthier options and controlling portions to manage weight; 3) trying to be more physically active; 4) trying additional ways to be physically active (using stairs or walk or bike to places); and 5) changes in the faith community environment (healthy snacks, healthy meals, and places to be physically active).
Detailed Findings

Faith Community Assessment (Pre/Post-test)

Key Findings and Recommendations

• Health/Wellness Infrastructure (see Tables 1 and 2 in Appendix A): The post-test score increased for six of the nine FBOs indicating an improvement in health and wellness infrastructure after implementing the curriculum. However, opportunities exist for participating faith-based organizations to including health as part of their mission statement, allocating budget for health related activities, periodically surveying members on health issues, establishing a health team or committee and appointing a person to be responsible for health related activities, and developing a lay health advisor program.

• Partnerships and Programs (see Tables 1 and 3 in Appendix A): Six of the nine FBOs improved their partnerships/collaborations and programs to support health and wellness of their community members. However, all FBOs may consider advancing their partnerships and programs, and annually offering health screenings (e.g., screening for blood pressure, blood cholesterol, blood sugar/diabetes, and healthy body weight) for their members.

• Physical Activity (see Table 1 and Tables 4–7 in Appendix A)
  o Environment: The post-test score increased for three of the nine FBOs. The participating FBOs may consider identifying additional ways for their members to be more physically active (e.g., exercise room, exercise equipment, walking trails, playgrounds, group classes).
  o Policies and Leadership: Three FBOs implemented a policy to provide physical activity opportunities at meetings or functions. The leadership at two FBOs promoted physical activity in a public speech or sermon.
  o Group/Support Classes: The post-test score increased for one FBO and remained unchanged for five FBOs. FBOs may consider organizing additional group classes to increase and promote physical activity.
  o Individual Education/Information: The post-test score increased for seven of the nine FBOs indicating an increase in individual education programs offered by FBOs. The FBOs may also consider promoting physical activity on the faith community website, bulletin boards, posters, flyers, and newsletter.
• Nutrition (see Table 1 and Tables 8–11 in Appendix A)
  o Environment: The post-test scores remained unchanged for seven of the nine FBOs. The FBOs may consider improving the nutrition environment by developing a community garden onsite to improve access to fresh fruits and vegetables.
  o Policies and Leadership: The post-test score increased for six of the nine FBOs. Five FBOs implemented policies to serve healthier options for faith community meals. The leadership at three FBOs promoted nutrition in a public speech or sermon.
  o Group Support/Classes: Six of the nine FBOs showed improvement in their post-test scores indicating an increase in the number of group/support classes for the members.
  o Individual Education/Information: The post-test score increased for five of the nine FBOs. All FBOs may consider identifying additional ways to promote and support nutrition and wellness of their members and promote nutrition on the faith community website.

Faith in Prevention Member Health and Interest Survey

Demographics (see Tables 12 and 13 in Appendix A)
Overall, 131 participants completed the pre-test. Nearly nine out of ten participants (87.4%) were females, about three out of ten (29.1%) completed some college or vocational school, and one-fourth (25.2%) completed high school. About eight out of ten (80.2%) were non-Hispanics, and more than nine out of ten (95.1%) were Black or African-American. For household income, three out of ten (30.5%) reported their income to be between $25,000 and $49,999, one-fourth (25.2%) reported it to be between $10,000 and $24,999, and nearly one-fifth (18.3%) said that it is under $10,000. Almost all participants (96.5%) said that their faith or spirituality is very important/important to their physical health.

Change in Knowledge (see Figures 1 and 2 below and Table 14 in Appendix A)
Overall, the participants reported an increase in understanding of five out of six survey items: healthy food choices, ways to include more fruits and vegetables in their diet, reading labels before buying food, benefits of physical activity for staying healthy, and interest in receiving health information that they can read, listen to or watch on their own after attending the sessions.

Among participants with matched pre- and post-test, the increase was mainly for understanding of healthy food choices (91.7% vs. 94.4%), reading food labels (61.4 vs. 64.3%), and understanding of benefits of physical activity (93.0% vs. 97.1%). A paired t-test for all six items indicated that the differences were not statistically significant (see Table 17 in Appendix A).
Figure 1: All Participants: Change in Knowledge after Attending the Workshop

Figure 2: Participants with Matched Pre- and Post-Test: Change in Knowledge after Attending the Workshop
Change in Behavior (see Figures 3 and 4 below and Table 15 in Appendix A)
Overall, an increased percentage of participants reported eating vegetables on most days (83.1% vs. 86.4%) and participating in physical activities or exercises (68.5% vs. 74.2%) after attending the sessions.

Among participants with matched pre- and post-test, a notable increase was seen in participation in physical activities or exercises (71.8% vs. 76.4%) after attending the session. A paired t-test indicated that the pre/post differences were not statistically significant (see Table 17 in Appendix A).
Nutrition (see Table 15 in Appendix A)

- Consumption of Sugar Sweetened Beverages (see Figures 5 and 6 below): The percentage of participants not drinking (21.9% vs. 25.8%) any sweetened beverages increased notably after attending the sessions. For other levels, the percentage decreased for two times per day (30.5% vs. 23.3%) or four or more times per day (11.7% vs. 9.1%).
  
  Among participants with matched pre- and post-test, the data indicated a similar trend. A paired t-test indicated a statistically significant difference in the consumption of sugar sweetened beverages before (mean=1.8, SD=1.3) and after (mean=1.5, SD=1.3) attending the sessions; t(69)= -2.4, p = 0.02. These results suggest that the sessions helped participants in reducing consumption of sweetened beverages (see Table 17 in Appendix A).

![Figure 5: All Participants: Change in Consumption of Sugar Sweetened Beverages](image-url)
Planning and Preparing Meals (see Figures 7 and 8 below): The percentage of participants preparing and eating more meals at home (81.4% vs. 89.3%), planning weekly meals (28.7% vs. 39.5%), choosing healthier food options and controlling portion size (47.3% vs. 65.9%) increased markedly after attending the sessions.

- The trend was similar among participants with matched pre- and post-test. A paired t-test indicated that the differences were statistically significant for choosing healthier options and controlling portion size to manage weight (pre-mean=2.1, SD=1.0; post-mean=2.3, SD=0.9; t(69)=3.0, p = 0.00). These results suggest that the sessions made participants more mindful of what and how much they are eating (see Table 17 in Appendix A).
Physical Activity (see Table 15 in Appendix A)

- **Number of Times per Week (see Figures 9 and 10 below):** The data illustrate a shift in trend as an increased percentage of participants reported more frequent participation in physical activity per week.
Among participants with matched pre- and post-test, the percentage increased for two times per week (13.9% vs. 16.7%), and three times per week (16.7% vs. 23.6%) but decreased for four or more times per week (31.9% vs. 29.2%). However, the differences were not statistically significant (see Table 17 in Appendix A).

**Figure 9: All Participants: Change in Participation in Physical Activity per Week in the Past Month**

![Figure 9](image)

**Figure 10: Participants with Matched Pre- and Post-Test: Change in Participation in Physical Activity per Week in the Past Month**

![Figure 10](image)
• **Efforts to Increase Physical Activity Level (see Figures 11 and 12 below):** The percentage increased markedly for all three survey items after attending the sessions: participants trying to be more physically active, using stairs instead of elevators or walking or biking instead of driving, and participating in team sports.

  o Among participants with matched pre- and post-test, the data indicated a similar trend. A paired t-test indicated that the differences were statistically significant for both trying to be more physically active (pre-mean=2.6, SD=0.8; post-mean=2.8, SD=0.5; t(68)= 3.0, *p = 0.00*); and using stairs or walking or biking to places (pre-mean=2.3, SD=0.9; post-mean=2.6, SD=0.8; t(70)= 3.7, *p = 0.00*). These results suggest that the sessions made participants more physically active, and helped them in identifying additional ways to increase their physical activity level (see Table 17 in Appendix A).
Change in My Faith Community (see Figures 13 and 14 below and Table 16 in Appendix A)

As a result of participation in the Faith in Prevention Initiative, an increased percentage of participants reported that their faith community serves healthy snacks (42.5% vs. 57.6%), serves healthy meals (44.4% vs. 63.6%), and has places (e.g., gym, playground, fitness room) available for members to be physically active (23.0% vs. 37.5%).

Among participants with matched pre- and post-test, the trend was similar and a paired t-test indicated that the differences were statistically significant for all three items: faith community serves healthy snacks (pre-mean=2.1, SD=0.8; post-mean=2.4, SD=0.8; t(68)= 3.7, \( p = 0.00 \)); faith community serves healthy meals (pre-mean=2.1, SD=0.9; post-mean=2.4, SD=0.8; t(67)= 2.6, \( p = 0.01 \)); and faith community has places available for members to be physically active (pre-mean=1.7, SD=0.9; post-mean=1.9, SD=0.9; t(67)= 2.3, \( p = 0.02 \)). The results indicate that as a result of participation in this grant, the FBOs made changes to their nutrition and physical activity environment and policies to improve health and wellness of their members (see Table 17 in Appendix A).
My faith community serves healthy snacks
My faith community serves healthy meals
My faith community has places to be physically active

Figure 13: All Participants: Changes in My Faith Community after Implementing the Curriculum

Figure 14: Participants with Matched Pre- and Post-Test: Changes in My Faith Community after Implementing the Curriculum
Section 2: Greater Newark Healthcare Coalition (GNHC)

Data Collection
GNHC submitted the following completed forms to CSHP for analysis. All participant data were de-identified and analyzed using SPSS.

Data Sources
- Faith Community Assessment: 7 FBOs completed the pre-test.
- Member Health and Interest Survey: 56 participants completed the pre-test and 36 completed the post-test.

Summary Findings
- Impact on FBOs: All faith-based organizations had at least some health and wellness infrastructure in place. The leadership at almost all FBOs promoted physical activity and nutrition in a public speech/sermon in the past 12 months. Four of the seven FBOs had a policy in place to offer water for faith community meals. Opportunities were identified across all participating faith-based organizations to strengthen partnerships, survey members on health issues, sponsor health screenings, implement policies to support physical activity at meetings, increase opportunities for physical activity, and promote nutrition policies and practices.
- Impact on Participants: Overall, the results indicate that participation in FFESMM sessions was associated with better outcomes for most measures (increase in knowledge and understanding of a healthier lifestyle, change in behavior for healthier eating and physical activity, increased skills to plan and eat more meals at home, and an improvement in faith community environment to support prevention and wellness).
  - Among matched participants, the pre/post differences were statistically significant for three survey items: 1) eating fruits on most days; 2) choosing healthier options and controlling portions to manage weight; and 3) planning weekly meals.
Detailed Findings

Faith Community Assessment (Pre/Post-test)

Key Findings and Recommendations (see Tables 1 and 2 in Appendix B)

- **Health/Wellness Infrastructure:** All seven FBOs reported appointing a person for all health related activities, and six of the seven FBOs established a health team or committee for their members. However, opportunities exist across all participating faith-based organizations to allocate a budget for health related activities, periodically survey members on health issues, and develop a lay health advisor program.

- **Partnerships and Programs:** Six of the seven FBOs developed and/or had existing partnerships with another health, health promotion, or human services agency. Five of the seven FBOs sponsored blood pressure screenings, and four FBOs sponsored a healthy body weight screening in the past 12 months. All FBOs may consider strengthening their partnerships and programs, and periodically offering/organizing health screenings (e.g., screening for blood pressure, blood cholesterol, blood sugar/diabetes, and healthy body weight) for their members.

- **Physical Activity:** All seven FBOs reported that the leadership promoted physical activity in a public speech in the past 12 months. However, all FBOs may consider identifying additional ways for their members to be more physically active (e.g., exercise room, exercise equipment, walking trials, playgrounds, fitness guides, group classes), developing policies for supporting physical activity opportunities at meetings or functions, and promoting physical activity through posted information, bulletins, and on their website.

- **Nutrition:** Six of the seven FBOs have a kitchen or place to prepare meals for the members, and their leadership promoted nutrition in a public speech/sermon in the past 12 months. Four of the seven FBOs had a policy in place to offer water for faith community meals, serve healthy foods at food events, offer weight loss support groups, and promote nutrition in bulletin, programs or newsletters. However, all FBOs may consider developing a community garden for their members, offering group classes to teach healthy cooking, organizing weight loss support groups, developing guidelines to offer healthier options for faith community meals, and finding additional ways to promote and support nutrition and wellness of their members.
Faith in Prevention Member Health and Interest Survey

Demographics (Tables 3 and 4 in Appendix B)
Overall, 56 participants completed the pre-test. More than nine out of ten participants (94.5%) were females, about three out of ten (29.1%) completed some college or vocational school, and nearly one-fifth (18.2%) completed four years of college. More than two-thirds (69.6%) were non-Hispanics, and 92.7% were Black or African-American. For household income, a little less than one-fourth (23.2%) said that their income is between $50,000 and $74,000, and 21.4% said that it is between $25,000 and $49,999. Almost all participants (98.1%) said that faith or spirituality is very important/important to their physical health.

Change in Knowledge (see Figures 1 and 2 below and Table 5 in Appendix B)
Overall, participants reported a notable increase in understanding of: healthy food choices (92.9% vs. 100.0%), ways to include more fruits and vegetables in their diet (94.5% vs. 100.0%), how to read labels before buying food (67.9% vs. 71.4%), and benefits of physical activity for staying healthy (94.4% vs. 100.0%) after attending the sessions. However, participants shared a little lesser interest (83.3% vs. 80.0%) in receiving health information that they can read, listen or watch on their own.

Figure 1: All Participants: Change in Knowledge after Attending the Workshop
Among participants with matched pre- and post-test, the data showed a similar trend. However, there was a notable increase in the percentage of participants (84.0% vs. 91.7%) interested in receiving health information that they can read, listen, or watch on their own. A paired t-test for all six items indicated that the differences were not statistically significant (see Table 8 in Appendix B).

![Figure 2: Participants with Matched Pre- and Post-Test: Change in Knowledge after Attending the Workshop](image)

**Change in Behavior (see Figures 3 and 4 below and Table 6 in Appendix B)**

Overall, an increased percentage of participants reported eating vegetables (87.5% vs. 94.4%) and fruits (77.4% vs. 85.3%) on most days. However, the percentage of participants participating in physical activities or exercises in the past month decreased (89.1% vs. 80.0%) after attending the sessions.

Among participants with matched pre- and post-test, the increase was more noticeable for fruits consumption (68.0% vs. 87.5%). In addition, the percentage of participants participating in physical activities or exercises remained same (92.0% vs. 91.7%) after attending the sessions. A paired t-test indicated a significant difference in the consumption of fruits before (mean=2.4, SD=0.9) and after (mean=2.6, SD=0.7) attending the sessions; t(23) = 2.4, *p = 0.03*. These results suggest that the sessions did have a positive impact on the fruits consumption behavior of participants (see Table 8 in Appendix B).
Nutrition (see Table 6 in Appendix B)

- Consumption of Sugar Sweetened Beverages (see Figures 5 and 6 below): Overall, the percentage of participants not drinking (29.1% vs. 25.0%) any sweetened beverages decreased after attending the sessions. For other levels, the percentages also decreased for
three times a day (10.9% vs. 5.6%) as well as four or more times a day (9.1% vs. 5.6%) but increased notably for once a day (18.2% vs. 30.6%).

- Among participants with matched pre- and post-test, the increase was for both once (16.7% vs. 24.0%) as well as twice (29.2% vs. 40.0%) a day. However, no participant reported drinking sugar sweetened beverages four or more times a day after attending the sessions. A paired t-test indicated that the pre/post differences were not statistically significant.

![Figure 5: All Participants: Change in Consumption of Sugar Sweetened Beverages](image)

![Figure 6: Participants with Matched Pre- and Post-Test: Change in Consumption of Sugar Sweetened Beverages](image)
• **Planning and Preparing Meals (see Figures 7 and 8 below):** Overall, the percentage of participants preparing and eating more meals at home (72.7% vs. 85.3%), planning weekly meals (24.1% vs. 39.4%), choosing healthier food options and controlling portion size (47.3% vs. 65.9%) increased markedly after attending the sessions.
  
  o Among participants with matched pre- and post-test, the data indicated a similar trend and the increase was more prominent for planning weekly meals (16.0% vs. 50.0%) as well as choosing healthier options and controlling portions (68.0% vs. 91.7%). A paired t-test indicated that the differences were statistically significant for both planning weekly meals (pre-mean=1.4, SD=0.8; post-mean=2.0, SD=1.0; t(21)=3.4, \( p = 0.00 \)) and choosing healthier options and controlling portions (pre-mean=2.4, SD=0.9; post-mean=2.8, SD=0.6; t(23)=2.6, \( p = 0.02 \)). These results suggest that the sessions helped participants in planning their weekly menu and made them more mindful of what and how much they are eating (see Table 8 in Appendix B).

![Figure 7: All Participants: Change in Eating Behavior after Attending the Workshop](image-url)
Physical Activity (see Table 6 in Appendix B)

- **Number of Times per Week (see Figures 9 and 10 below):** The percentage of participants not participating in any physical activity decreased slightly (5.4% vs. 2.8%) after attending the sessions. For other frequencies, the percentage increased for two times per week (21.4% vs. 25.0%) but decreased for three times per week (23.2% vs. 11.1%).
  
  - Among participants with matched pre- and post-test, the percentage increased for two times per week (20.0% vs. 36.0%), and four or more times per week (24.0% vs. 32.0%) but decreased for three times per week (36.0% vs. 16.0%). However, the differences were not statistically significant.
Figure 9: All Participants: Change in Participation in Physical Activity per Week in the Past Month

Figure 10: Participants with Matched Pre- and Post-Test: Change in Participation in Physical Activity per Week in the Past Month
Efforts to Increase Physical Activity Level (see Figures 11 and 12 below): Overall, the percentage of participants trying to be more physically active (84.9% vs. 97.1%) increased markedly after attending the sessions. However, there was no change in the percentage of participants trying to increase their physical activity level in specific ways such as using stairs or walking or biking to places (55.6% vs. 54.5%) and participating in team sports (14.8% vs. 14.3%).

- Among participants with matched pre- and post-test, there was a small increase in the percentage trying to be more physically active (95.8% vs. 100.0%) and decrease in participation in team sports (12.0% vs. 8.3%) after attending the sessions. However, the differences were not statistically significant.

Figure 11: All Participants: Change in Physical Activity Behavior after Attending the Workshop

![Chart showing change in physical activity behavior](chart.png)
Change in My Faith Community (see Figures 13 and 14 below and Table 7 in Appendix B)

As a result of participation in the Faith in Prevention Initiative, an increased percentage of participants reported that their faith community serves healthy snacks (25.0% vs. 51.4%), serves healthy meals (33.3% vs. 57.1%), and has places (e.g., gym, playground, fitness room) available for members to be physically active (46.3% vs. 72.7%).

- Among participants with matched pre- and post-test, the data indicated a similar trend for all three survey items. However, the differences were not statistically significant.
My faith community serves healthy snacks

My faith community serves healthy meals

My faith community has places to be physically active

Figure 13: All Participants: Changes in My Faith Community after Implementing the Curriculum

Figure 14: Participants with Matched Pre- and Post-Test: Changes in My Faith Community after Implementing the Curriculum
Section 3: Trenton Health Team (THT)

Data Collection
THT submitted the following completed forms to CSHP for analysis. All participant data were de-identified, and analyzed using SPSS.

Data Sources
- Faith Community Assessment: 10 faith-based organizations (FBOs) completed the pre-test and 8 FBOs completed the post-test.
- Eat Smart, Move More Member Health and Interest Survey: 163 participants completed the survey.
- Participant Survey: 122 participants completed the survey. In addition, 9 completed the Spanish version of pre-test for post-test.
- Three month Post-test: 25 participants from 2 FBOs completed the survey.

Summary Findings
- Impact on FBOs: As a result of participation in this initiative, all FBOs made many changes to their health and wellness infrastructure, partnerships and programs, and physical activity and nutrition environment and policies. Overall, two FBOs implemented physical activity policies and four FBOs implemented policies for serving healthy meals. They may consider completing this tool annually to identify their needs and priorities for improving their infrastructure, identifying additional partnerships, increasing opportunities for physical activity, and developing new nutrition policies and practices.
- Impact on Participants: Overall, the majority of participants shared interest in learning about healthy food choices, portion sizes, benefits of physical activity, and increasing their physical activity level. Participants also shared a strong interest in seeing policy and environmental changes in their faith community (healthy snacks, healthy meals, places to be physically active, and regular classes offered on healthy eating or physical activity).
  - The post-test shows that the FFESMM sessions made nearly eight out of ten participants mindful of their diet and getting physical activity every day. More than 60% of participants reported improvement in eating smaller portions, increasing
consumption of fruits and vegetables, drinking fewer calorie containing beverages, preparing more meals at home, and participation in physical activities.

- The three month post-test results support a long-term impact of the program. Participants indicated a continued interest in learning about healthy eating three months after completing the six week FFESMM sessions. Overall, a notable increase in consumption of fruits and vegetables was seen in the three month post-test. A decreased percentage of participants shared interest in seeing healthy meals served for the faith community meals in the three month post-test. However, an increased percentage of participants reported interest in seeing their leaders talk about healthy eating and physical activity in sermons, messages or other talks, and their faith community regularly offering classes on physical activity or healthy eating.

**Detailed Findings**

**Faith Community Assessment (Pre/Post-test)**

**Key Findings and Recommendations**

**Health/Wellness Infrastructure (see Tables 1 and 2 in Appendix C)**

The post-test score increased for three of the ten FBOs indicating an improvement in health and wellness infrastructure after implementing the curriculum. However, opportunities exist for participating faith-based organizations to sponsor health fairs for members, establish a health team or committee, and appoint a person to be responsible for health related activities.

**Physical Activity (see Tables 1, 3 and 4 in Appendix C)**

- **Policies and Environment:** The post-test score increased for eight of the ten FBOs. Six FBOs made changes to their environment for their members to be more physically active (e.g., exercise room, exercise equipment, walking trails, playgrounds, group classes), and two FBOs implemented policies for supporting physical activity opportunities at meetings or functions.

- **Programs and Education:** The post-test score increased for six of the ten FBOs. This indicates that FBOs may consider organizing additional group classes for increasing and promoting physical activity. They may also consider promoting physical activity through posted information, bulletins, and newsletters.

**Nutrition (see Tables 1, 5 and 6 in Appendix C)**

- **Policies and Environment:** The post-test scores increased for four FBOs and remained unchanged for four FBOs. Three FBOs developed a community garden and four FBOs implemented policies to offer healthier options for faith community meals. The FBOs may consider developing a community garden with the help of the members, supporting healthier eating.
meal preparation, and developing guidelines to offer healthier options for faith community meals.

- **Programs and Education:** The post-test score increased for seven of the ten FBOs. This indicates that FBOs may consider identifying additional ways such as group/support classes to promote and support nutrition and wellness of their members.

**Eat Smart, Move More Member Health and Interest Survey**

Healthy Eating and Physical Activity Habits (see Figures 1 and 2 below and Table 7 in Appendix C)

- A little less than half (46.4%) of participants reported eating two–three cups of vegetables on most days and nearly six out of ten (58.5%) reported eating one and half–two cups of fruits on most days.
- More than seven out of ten (72.6%) reported not drinking regular soda every day.
- More than eight out of ten (83.1%) reported doing 30 or more minutes of moderate or vigorous physical activity in addition to their normal routine on most days.

Interest in Learning about Eating Healthy and Physical Activity (see Figures 3 and 4 below and Table 8 in Appendix C)

- More than nine out of ten participants (>90%) shared interest in learning about healthy food choices, incorporating fruits and vegetables into their diet, portion size, benefits of physical activity, and Increasing physical activity level.
- Three-fourths (75.0%) shared interest in participating in team activities.
Learning about healthy food choices

Learning about incorporating fruits and vegetables

Learning about healthier food choices and portion size

Learning about benefits of physical activity

Participating in “tasting” events to sample healthy foods

Increasing my physical activity level

Walking to increase my physical activity level

Participating in team activities
Interest in Seeing Changes in the Faith Community (see Figure 5 below and Table 9 in Appendix C)

- Participants shared a strong interest in seeing policy and environmental changes, such as availability of healthy snacks (95.5%), healthy meals (92.7%), and more places to be physically active (92.3%) implemented in their faith community.
- Nearly two-thirds (64.7%) said that they would like their leader to talk about healthy eating and physical activity in sermons, messages, or other talks.
- About nine out of ten (90.4%) reported that they would like their faith community to regularly offer physical activity or healthy eating classes.

Interest in Participation in Health Activities (see Figure 6 below and Table 10 in Appendix C)

- Nearly five out of ten (49.0%) participants reported that they would like to participate in health activities before services, and 46.5% said that they would like to participate after services.
- About eight out of ten (79.2%) shared interest in participating in health activities like physical activity breaks or healthy food tastings during regularly scheduled faith community events.
Preferred Methods for Receiving Health Information (see Figure 7 below and Table 11 in Appendix C)

- More than nine out of ten (91.3%) said that they would like to receive health information that they can read, listen to, or watch on their own.
- Nearly three-fourths (74.8%) said that they would like to see health information in bulletins, newsletters, and on bulletin boards.
**Participant Survey**

**Demographics (see Table 12 in Appendix C)**
- Overall, 122 participants completed this survey and nine participants completed the Spanish version of pre-test for post-test.
- Nearly eight out of ten (77.7%) participants were female.
- About one-third (33.7%) were aged 55 or older. However, 14.7% were under 25 years of age.
- More than half (51.7%) of the participants were African American, nearly one-third (31.7%) were Hispanic/Latino, and the rest were White (6.7%), American Indian (0.8%) or Other (4.2%). Moreover, 4.9% of participants reported more than one race.

**Program Effect (see Figures 8 and 9 below and Table 13 in Appendix C)**
As a result of participation in this program, participants reported improvements in the following areas:
- **Nutrition**
  - More than eight out of ten (84.3%) reported that they are now mindful of their diet, and more than three-fourths (78.3%) said that they are more mindful of getting physical activity every day.
  - More than three-fourths (77.7%) reported controlling portion sizes, and more than two-thirds reported eating less fast food (68.9%) and drinking fewer calorie containing beverages (67.8).
  - About six out of ten reported preparing and eating more meals at home (60.5%), and eating two-three cups of vegetables (62.5%), and one and a half–two cups of fruits (60.7%) on most days. However, one-fourth participants reported not eating two–three cups of vegetables (25.0%) and one a half–two cups of fruits (25.6%).
- **Physical Activity**
  - As a result of participating in this program, more than two-thirds (66.9%) reported doing at least 30 minutes of physical activity on most days.
- **Screen Time**
  - More than six out of ten reported limiting screen time for themselves (63.6%) as well as their family (61.1%).
Figure 8: Effect of FFESMM Program on Nutrition

- Eat smaller portions: 77.7% (Yes), 10.7% (No), 11.6% (Was already doing)
- More mindful of what and how much I eat: 84.3% (Yes), 5.8% (No), 9.9% (Was already doing)
- Drink fewer calorie containing beverages: 67.8% (Yes), 6.8% (No), 25.4% (Was already doing)
- Eat less fast food: 68.9% (Yes), 7.6% (No), 23.5% (Was already doing)
- Eat 1.5 – 2 cups of fruits on most days: 60.7% (Yes), 25.6% (No), 13.7% (Was already doing)
- Eat breakfast most days: 54.5% (Yes), 25.6% (No), 19.8% (Was already doing)
- Eat 2-3 cups of vegetables on most days: 62.5% (Yes), 25.0% (No), 12.5% (Was already doing)
- Prepare and eat more meals at home: 60.5% (Yes), 6.7% (No), 32.8% (Was already doing)

Figure 9: Effect of FFESMM Program on Physical Activity Habits

- More mindful of getting physical activity each day: 78.3% (Yes), 4.2% (No), 17.5% (Was already doing)
- Physically active at least 30 minutes most days: 66.9% (Yes), 7.6% (No), 25.4% (Was already doing)
- Limit screen time for my family: 61.1% (Yes), 22.1% (No), 16.8% (Was already doing)
- Limit screen time for myself: 63.6% (Yes), 19.8% (No), 16.5% (Was already doing)
**Eat Smart, Move More Member Health and Interest Survey Pre- and Three Month Post-test**

Two FBOs collected three month post-test data. The analysis below compares pre- (N = 22) and three month post-test (N = 25) of two FBOs.

**Healthy Eating and Physical Activity Habits (see Figures 10 and 11 below and Table 14 in Appendix C)**

- Overall, the participants reported a notable increase in consumption of two–three cups of vegetables (36.4% vs. 68.0%) and one a half–two cups of fruits (66.7% vs. 75.0%) on most days in the three month post-test.
- The percentage of participants drinking regular soda (27.3 vs. 24.0) decreased in the three month post-test.
- For physical activity, the percentage increased for participants spending 30–60 minutes (27.3% vs. 37.5%) in moderate or vigorous physical activity on most days in addition to their normal routine.

![Figure 10: Pre- and 3 Month Post-test: Healthy Eating Habits](image-url)
Interest in Learning about Eating Healthy and Physical Activity (see Figures 12 and 13 below and Table 15 in Appendix C)

- The data indicated a consistent interest in learning about healthy eating and portion size three months after completing the sessions.
- For physical activity, participants shared a little lesser interest in learning about benefits of physical activity (86.4% vs. 83.3%), and increasing their physical activity level (81.8% vs. 75.0%), and more interest in participating in team activities (57.1% vs. 68.0%).
Interest in Seeing Changes in the Faith Community (see Figure 14 below and Table 16 in Appendix C)

- The interest in seeing healthy meals served for the faith community meals decreased in the three month post-test (90.0% vs. 83.3%). However, an increase was seen in the percentage of participants interested in seeing their leaders talk about healthy eating and physical activity in sermons, messages or other talks (63.6% vs. 78.3%), and their faith community regularly offering classes on physical activity or healthy eating (80.0% vs. 87.5%).
Interest in Participation in Health Activities (see Figure 15 below and Table 17 in Appendix C)
There was a slight increase in the percentage of participants interested in participating in health activities before services (50.0% vs. 52.2%) or after services (47.6% vs. 52.2%). However, the percentage of participants interested in participating in physical activity breaks or healthy food tasting during regularly scheduled faith community events increased markedly in the three month post-test.
Preferred Methods for Receiving Health Information (see Figure 16 below and Table 18 in Appendix C)

The three month post-test indicates an increased interest in receiving health information that participants can read, listen to, or watch on their own (90.0% vs. 96.0%) as well as seeing the health information in bulletins, newsletters and on bulletin boards (85.7% vs. 88.0).
Challenges

Participant Retention: Nearly half of the participants completed both pre- and post-test in Camden and Newark and about six out of ten completed both pre- and post-test in Trenton. Flexibility in scheduling and exploring strategies for recruitment and retention may help in increasing both program participation and completion rates.

- **Staff Turnover:** Impacted the full delivery of the first year requirements at one site and delayed data collection.
- **Different Versions of the Form:** Impacted pre/post comparison and across-the-board analysis.

Conclusion

The Faith in Prevention Initiative has potential for broader reach, adoption, implementation, and greater impact. The program can be adapted to fit the needs of any faith community and its members. Participation in this grant helped the FBOs identify and adopt policies and practices that support the health and wellness of their members. The participating FBOs were at different stages of readiness to support member health and wellness. With regard to their participation, all 26 participating FBOs completed all elements of the program and made multiple positive changes to their food and physical activity policies and environments. They may consider completing this tool annually to identify most pressing needs of their community, discuss the priorities with the leadership and community members, and create an action plan to build healthier communities.

The impact of the program on participants was evident by better outcomes for most measures (including increased knowledge and understanding, change in behavior for healthier eating and physical activity, and an improvement in faith community environment to support healthier lifestyle) in all three cities. The pre/post differences were statistically significant for seven items in Camden and three items in Newark. The findings show that FFESMM sessions had a positive effect on participants and increased their consumption of fruits and vegetables, provided the skills and motivation to eat more meals at home, and increased regular physical activity. The three month post-test indicated that the behavioral changes sustained after three months of program completion. This suggests that implementing FFESMM may help FBOs improve health and the quality of life of their congregants.

   □ Jewish (Conservative)           □ Jewish (Orthodox)                             □ Presbyterian Church of Am.
   □ Lutheran                         □ Methodist                                    □ United Church of Christ
   □ Pentecostal                    □ Presbyterian (USA)                            □ Hindu
   □ Roman Catholic                  □ Seventh Day Adventist                         □ Muslim
   □ Non-denominational Christian    □ Inter-denominational Christian                □ Buddhist
   □ Other Tradition: __________________________

2. What is interviewee’s role in the organization?
   □ Pastor/Priest/Rabbi/Imam      □ Deacon                                            □ Member
   □ Other:______________________________________________

3. About what percent of the faith community is made up of:
   ____ Hispanics                          ____ White                           ____ Black or African American
   ____ American Indian or Alaska Native  ____ Native Hawaiian                    ____ Vietnamese
   ____ Asian Indian                      ____ Guamanian or Chamorro              ____ Korean
   ____ Chinese                           ____ Samoan                             ____ Japanese
   ____ Filipino                          ____ Other Pacific Islander              ____ Other Asian
4. Number of members of faith community: __________

5. About what percentage of the faith community is: ______ Male  ______ Female  ______ Transgender

6. Percentage of the faith community aged:
   _____0–12 Years  _____13–24 Years  _____25–35 Years
   _____36–54 Years  _____55–66 Years  _____67 and older

7. What are the languages spoken/written by your congregants other than English and Spanish?
   ________________________________________________________________

HEALTH/WELLNESS INFRASTRUCTURE

8. Does the faith community have “health” as part of its creed or mission statement  □ yes  □ no  □ don’t know

9. Does the faith community have an active health team or committee?  □ yes  □ no  □ don’t know

10. Does the faith community have a person appointed to be responsible for health related activities?  □ yes  □ no  □ don’t know

11. Does the faith community have a lay health advisor program?  □ yes  □ no  □ don’t know

12. Has the faith community surveyed members on health issues in the past 12 months? (choose all that apply)
    □ yes, a survey was conducted to help community leaders understand the health issues of the membership (e.g. needs assessment)
    □ yes, surveys or forms were used to help community members identify their own personal lifestyle risk profile (e.g. health risk appraisals)
    □ no surveys were used
    □ don’t know

13. Does the faith community have a budget for health promotion or health related activities?  □ yes  □ no  □ don’t know

14. Has the faith community ever established health or wellness goals for the organization/membership?  □ yes  □ no  □ don’t know

Score: ____ (# of Yes answers) out of 7

PARTNERSHIPS AND PROGRAMS

15.Has the faith community sponsored a health fair during the past 12 months?  □ yes  □ no  □ don’t know
   In the past 12 months, has the faith community offered:
   blood pressure screening?  □ yes  □ no  □ don’t know
   cholesterol screening?  □ yes  □ no  □ don’t know
blood sugar/diabetes screening? □ yes □ no □ don’t know
healthy body weight screening? □ yes □ no □ don’t know

16. Has the faith community participated in a parish nursing program within the past 12 months? □ yes □ no □ don’t know

17. Do any members currently represent the faith community by serving on a community health coalition or committee (e.g. fitness/nutrition council)? □ yes □ no □ don’t know

18. Has the faith community had a relationship with another health, health promotion, or human services agency to provide services to members in the past 12 months? □ yes □ no □ don’t know

If so, what are those agencies?

Agency 1: _______________________________ Agency 2: _______________________________
Agency 3: _______________________________ Agency 4: _______________________________

Score: _____ (# of Yes answers) out of 8

PEOPLE

19. How many of the following people are members of this faith community?

Physicians/doctors ____________________________ Other health professionals ____________________________
Dentists ____________________________ Type of health professionals counted above:
Nurses/CNAs ____________________________
Health educators ____________________________

PHYSICAL ACTIVITY—ENVIRONMENT

20. Does the faith community have an exercise room? □ yes □ no □ don’t know

21. Does the faith community have any exercise equipment on-site? □ yes □ no □ don’t know

22. Does the faith community have a walking trail? □ yes □ no □ don’t know

23. Does the faith community have any outdoor courts or ball fields? □ yes □ no □ don’t know

24. Does the faith community have a playground? □ yes □ no □ don’t know

Score: _____ (# of Yes answers) out of 5

PHYSICAL ACTIVITY—POLICIES AND LEADERSHIP

25. Does the faith community have a policy supporting physical activity opportunities at meetings or functions (e.g. walks, exercise breaks)? □ yes □ no □ don’t know
26. Has the faith community provided **physical activity opportunities at meetings** or functions in past 12 months (e.g. walks, exercise breaks)?
   [ ] yes  [ ] no  [ ] don’t know

27. Has leadership promoted **physical activity in a public speech or sermon** in the past 12 months?
   [ ] yes  [ ] no  [ ] don’t know

Score: ______(# of Yes answers) out of 4

---

**PHYSICAL ACTIVITY—GROUP SUPPORT/CLASSES**

27. Has the faith community conducted any **aerobics classes** in the past 12 months?
   [ ] yes  [ ] no  [ ] don’t know

28. Has the faith community promoted walking clubs in the past 12 months?
   [ ] yes  [ ] no  [ ] don’t know

29. Has the faith community sponsored or supported sports team for members in the past 12 months?
   [ ] yes  [ ] no  [ ] don’t know

Score: ______(# of Yes answers) out of 3

---

**PHYSICAL ACTIVITY—INDIVIDUAL EDUCATION/INFORMATION**

31. Has the faith community provided any **individual fitness counseling** in the past 12 months?
   [ ] yes  [ ] no  [ ] don’t know

32. Has the faith community **distributed any fitness guides** to members in the past 12 months?
   [ ] yes  [ ] no  [ ] don’t know

*This survey is adapted from North Carolina’s Faithful Families Eating Smart and Moving More Program*
Faith in Prevention Member Health and Interest Survey*

Pre-Workshop Participant Survey

Directions: The survey will take approximately 10 minutes to complete. Your participation is completely voluntary and confidential and our report will include only total information. Please read each statement or question carefully and give the response that best describes you. Your responses are very important to us.

ID Number: _____________  Date: _________________        Zip Code: _________________

1. I eat vegetables most days.  □ Yes  □ No  □ Not Sure

2. If you answered yes to Question 1, on average, how many servings of vegetables do you eat per day? Some examples of one serving of vegetables are 1 cup of raw, leafy vegetables like lettuce or greens (about the size of a baseball), or ½ cup of chopped vegetables such as carrots (about the size of a computer mouse).

   □ 1  □ 4  □ 7  □ 10 or more
   □ 2  □ 5  □ 8
   □ 3  □ 6  □ 9

3. I eat fruits most days.  □ Yes  □ No  □ Not Sure

4. If you answered yes to Question 3, on average, how many servings of fruit do you eat per day? Some examples of one serving of fruit would be one medium apple, orange, pear, or banana, or ½ cup of chopped or canned fruit (about the size of a computer mouse).

   □ 1  □ 4  □ 7  □ 10 or more
   □ 2  □ 5  □ 8
   □ 3  □ 6  □ 9

5. On a typical day, how many times do you drink sweetened beverages, not including diet or sugar-free beverages?

   □ One time  □ Four or More Times
   □ Two Times  □ None
   □ Three Times
6. During the past month, other than your regular job, did you participate in any physical activities or exercises such as running, golf, gardening, or walking for exercise?

☐ Yes  ☐ No  ☐ Not Sure

7. If you answered yes to Question 6, how many times per week did you take part in these activities during the past month?

☐ One time  ☐ Four or More Times
☐ Two Times  ☐ None
☐ Three Times

Please check the box that best describes you:

8. I understand what healthy food choices mean.

☐ Yes  ☐ No  ☐ Not Sure

9. I prepare and eat more meals at home.

☐ Yes  ☐ No  ☐ Not Sure

10. I plan weekly meals and make a grocery list of the planned menu.

☐ Yes  ☐ No  ☐ Not Sure

11. I know how to include fruits and vegetables into my diet.

☐ Yes  ☐ No  ☐ Not Sure

12. I often choose healthier food and control portions of my food to manage my weight.

☐ Yes  ☐ No  ☐ Not Sure

13. I don’t like the taste of many foods that are called healthy.

☐ Yes  ☐ No  ☐ Not Sure

14. When shopping for food, I look at the food label before buying.

☐ Yes  ☐ No  ☐ Not Sure

15. Sometimes I leave foods such as meat, dairy products out of the refrigerator for more than 2 hours.

☐ Yes  ☐ No  ☐ Not Sure

☐ Yes  ☐ No  ☐ Not Sure

17. My faith community serves healthy meals.

☐ Yes  ☐ No  ☐ Not Sure

18. I understand the benefits of physical activity and how it can make me healthier.

☐ Yes  ☐ No  ☐ Not Sure

19. I try to be more physically active.

☐ Yes  ☐ No  ☐ Not Sure

20. I use stairs instead of elevator, or walk or bike to places instead of driving to increase my physical activity level.

☐ Yes  ☐ No  ☐ Not Sure

21. I participate in team activities (e.g. basketball, baseball, soccer, other).

☐ Yes  ☐ No  ☐ Not Sure

22. My faith community has places available for me to be physically active (gym, playground, fitness room).

☐ Yes  ☐ No  ☐ Not Sure

23. I would like to receive health information that I can read, listen to or watch on my own.

☐ Yes  ☐ No  ☐ Not Sure
24. Are there reasons why you cannot find healthy food choices in your neighborhood? Tell us what those reasons are.

25. What is your gender? □ Male □ Female □ Transgender

26. What is your highest grade completed in school?

□ Grade 8 or below □ Some college
□ Some high school □ Graduated 2 year college
□ Grade 12 or GED □ Graduated 4 year college
□ Post graduate

27. Are you Hispanic, Latino/a, or Spanish origin (one or more categories may be selected)

□ No, not of Hispanic, Latino/a, or Spanish origin
□ Yes, Mexican, Mexican American, Chicano/a
□ Yes, Puerto Rican
□ Yes, Cuban
□ Yes, another Hispanic, Latino, or Spanish origin

28. What is your race? (One or more categories may be selected)

□ White □ Korean
□ Black or African American □ Vietnamese
□ American Indian or Alaska Native □ Other Asian
□ Asian Indian □ Native Hawaiian
□ Chinese □ Guamanian or Chamorro
□ Filipino □ Samoan
□ Japanese □ Other Pacific Islander

29. At this time what is your total household income? (The information provided is completely confidential)

□ Less than 10,000 □ $50,000 - $74,999
□ $10,000 - $24,999 □ $75,000 - $99,999
□ $25,000 - $49,999 □ $100,000 or over

30. What is your height? ____________ feet ________ inches

(__________________________)
31. What is your weight? _______ (________________________)

32. How important is your faith or spirituality to your physical health (check one)?
   - [ ] Very important
   - [ ] Important
   - [ ] A little important
   - [ ] Not important

33. If you answered important, very important or moderately important to the question above, why is your faith or spirituality important to your physical health?
   __________________________________________________________________________________________________________
   __________________________________________________________________________________________________________
   __________________________________________________________________________________________________________
   __________________________________________________________________________________________________________

34. When would you like to participate in events or programs around healthy eating and physical activity in your faith community (check all that apply)?
   - [ ] Before services
   - [ ] After services
   - [ ] Sundays
   - [ ] Wednesday evenings
   - [ ] Friday evenings
   - [ ] Saturdays
   - [ ] Other: _______________

35. How would you like to receive information about eating smart and moving more (check all that apply)?
   - [ ] Bulletin inserts, program inserts or newsletter articles
   - [ ] Incorporated into weekly sermons, homilies, or leader’s lessons
   - [ ] Educational classes (Sunday School or Bible Study/Weekly Scripture)
   - [ ] Mailed to my home
   - [ ] Other: _______________
